Project description:

This project will create a unique version control tool called SnickerSync and GiggleGit. SnickerSync will allow users to enhance the Git diff and merge as it integrates humor by “syncing with a snicker.” I will conduct user studies to gather data on the impact of SnickerSync on user interaction and satisfaction. This project will have a vanilla interface capable of syncing with the base GiggleGit packages. GiggleGit is a meme-based version control system created to provide an enjoyable experience during the development process for users.

Project requirements

Goal: Create an engaging experience while code-syncing using SnickerSync to captivate users and make them enjoy using this tool.

Non-Goal: Creating personalized content based on the user behavior or their contributions to their repositories.

Non-functional requirement 1: Security

Functional requirements:

- Verify users when accessing their accounts and give authority to certain users that control access to some diffs.
- Implement a hierarchical authority system where there are different levels of authority and it allows higher-levels can control lower-level users.

Non-functional requirement 2: Maintaining “snickering” concepts

Functional requirements:

- PMs have an admin interface that allows them to view, edit, and delete “snickering” concepts.
- Maintain a log of changes made to their concepts that provides accountability between PMs.

Agile

Theme: Get GigggleGit demo into a stable enough alpha to start onboarding some adventurous clients

Epic: Onboarding experience

User story 1: As a vanilla git power-user that has never seen GigggleGit before, I want to learn how vanilla git and GigggleGit differ so I can merge efficiently using memes.

User story 2: As a team lead onboarding an experienced GigggleGit user, I want to allow my team to collaborate with minimized delays by accessing good documentation.

User story 3: As a collaborative developer, I want to be able to customize meme templates so that my humor is displayed to my team. There will be an increase in team synergy and unification in my team through this humor.

Task: Add customizability

- Ticket 1: Add custom meme template feature
 - Add functionality to allow users to upload and save meme templates using multiple file types (PNG, JPG, etc.) to their accounts. Users should experience smooth integration and templates will be easily retrievable when added.
- Ticket 2: Create a template management system
 - Implement a user-friendly interface that allows users to drag and drop templates for uploading and deleting. This functionality should include error handling and feedback on whether their uploads are successful.

This is not a user story. Why not? What is it?

As a user I want to be able to authenticate on a new machine

“As a user, I want to be able to authenticate on a new machine” is not a user story because it does not explain the authentication’s reason or purpose. If it were something like, “As a user, I want to be able to authenticate on a new machine to ensure proper security is maintained, and the private information of users is not accessed by others,” it would be a valid user story.
